

I'll Get Back to You

Task, Await, and Asynchronous Programming

Jeremy Clark

@jeremybytes

Asynchronous Patterns

- Asynchronous Programming Model (APM)
- Event Asynchronous Pattern (EAP)
- Task Asynchronous Pattern (TAP)

Asynchronous Programming Model (APM)

- Method-Based
- Methods
 - BeginGetData()
 - EndGetData()
- IAsyncResult

Event Asynchronous Pattern (EAP)

- Method/Event-Based
 - Method
 - GetDataAsync()
 - Event
 - GetDataCompleted
 - Results in EventArgs
- BackgroundWorker – Easy-to-use wrapper

Task Asynchronous Pattern (TAP)

- Task-Based
- Method Returns a Task
 - `Task<T> GetDataAsync()`
- Task
 - Represents a concurrent operation
 - May or may not operate on a separate thread
 - Can be chained and combined

async & await

- Syntactic Wrapper Around Task
 - “await” pauses the current method until Task is complete.
 - Looks like a blocking operation
 - Does not block current thread
- “async” is just a Hint
 - Does not make a method run asynchronously
 - Tells the compiler to treat “await” as noted above

Task Properties

- Task Properties
 - IsCanceled
 - IsCompleted*
 - IsFaulted

IsCompletedSuccessfully

- .NET Core
- .NET Standard 2.1
- NOT .NET Standard 2.0
- NOT .NET Framework

**Note: Means “no longer running” not “completed successfully”*

Task Properties

- Task Properties
 - IsCanceled
 - IsCompleted*
 - IsFaulted
 - Status

**Note: Means “no longer running” not “completed successfully”*

- TaskStatus
 - **Canceled**
 - Created
 - **Faulted**
 - **RanToCompletion**
 - Running
 - WaitingForActivation
 - WaitingForChildrenToComplete
 - WaitingToRun

Exception Handling

- `AggregateException`
 - Tree structure
- `Flatten()`
 - Flattens the tree structure to a single level

Cancellation

- CancellationToken is ReadOnly
 - new CancellationToken(true)
 - new CancellationToken(false)
- CancellationTokenSource
 - var cts = new CancellationTokenSource()
 - var token = cts.Token
 - cts.Cancel()

Thank You!
